

WHAT CAN DTL DATA DO FOR YOU?

DTL Data offers:

- **Tools** for handling data and up to date reference **databases**
- **ICT infrastructure** to handle large amounts of life science data
- **Education** and **Training** for in data handling
- Standard **protocols** and adaptable **work flows** for data handling
- A **Calendar of events**

... and the **experts** and expertise to help you in applying all these in your project.

The DTL Data programme organises all experts in the Netherlands that work on data management, also more broadly called data stewardship, in life sciences. The programme assembles experts in computer and network infrastructure, mathematics and (bio-)statistics, all the way to *omics and data integration.

DTL Data bridges the gap between life sciences and data experts. For this reason DTL Data has people that are working in the different life science domains. We currently work in **health care data**, agriculture and livestock data, **nutrition data**, and industrial biotechnology data.

We have a large force of people that are experts in data handling in life sciences. If you're planning a project, you can **contact us** at an early stage to help you deal with the data you will generate, including budgeting for data processing and planning for (long term) data storage.
